Dear Baratam Praneeth Gupta,

Welcome to Day 1 of the GoboxD Hackathon. We received **293 registrations** — the competition will be demanding, and we are glad you are in it. More details about the registration and the guiding philosophy of the competition are posted in the initial [Github Discussion](#). Please do go through the post once very carefully before starting your development work.

Your registration details are below. Please verify them and raise a correction in [Github Discussions](#) if anything looks wrong.

REGISTRATION DETAILS

Team Name	Team Sudo
GitHub Repository	https://github.com/Praneeth0910/goboxd
Go Experience	None — I have not written Go before

WHO YOU ARE COMPETING WITH

A quick snapshot of the 293 participants who registered.

98%

Active students

2%

Alumni

84%

Solo participants

85%

New to Go

85% of participants have no prior Go experience or very limited exposure. You are not at a disadvantage — this is the starting point for most people in this cohort. The problem is designed so that learning Go and building the service happen in parallel.

WHY PEOPLE REGISTERED

Four themes came through clearly in the registration responses.

Systems programming and Linux internals

Sandboxing, process isolation, cgroups, namespaces, syscalls. Many want to understand concretely how online judges enforce memory and time limits — this hackathon is that problem.

Learning Go in a real project

Most participants are using this as their first substantial Go project — applying knowledge from other languages and building proficiency in concurrent, systems-level Go.

Practical, portfolio-worthy experience

Working on a real infrastructure problem under competitive constraints, producing something demonstrable rather than a tutorial exercise.

Open source contribution

Learning how collaborative engineering projects are run — PRs, code review, documentation — and contributing to a real codebase rather than a private assignment.

KEY LINKS

[Hackathon Spec](#) — full technical brief

[GitHub Discussions](#) — announcements, Q&A, and updates

[Submission Repository](#) — fork and branch from here

Watch GitHub Discussions for all announcements — that is the only channel we will use during Phase 1.

Regards,

SEEK Team
